## Introduction

Today world web applications are very helpful to make life easier and smart. Hospital website, banking website, social media websites are some of these web applications in nova days to build these site we use many programming languages There are python, java, HTML, PHP and Angular.

In the in this project, we try to implement a medical web application using Java beans, Java Servlets and Java Server Pages (JSP) using the NetBeans IDE (8.2)

JSP is a server-side technology that does all the processing at server. It is used for creating dynamic web applications, using java as programming language. This JSP pages consist with HTML and JSP tags. In JSP we can embed java code in HTML using JSP tags.

Tools

- NetBeans IDE (8.2)
- Glassfish Server.
- Java DB database.
